

Our project is about to work fine, however due to the tight time frame we did not make the connections so that the server will return the information to the client, but a series of steps are presented below to test the functionality of the project, even if it is for separate but meets teacher requirements.

CLIENT:

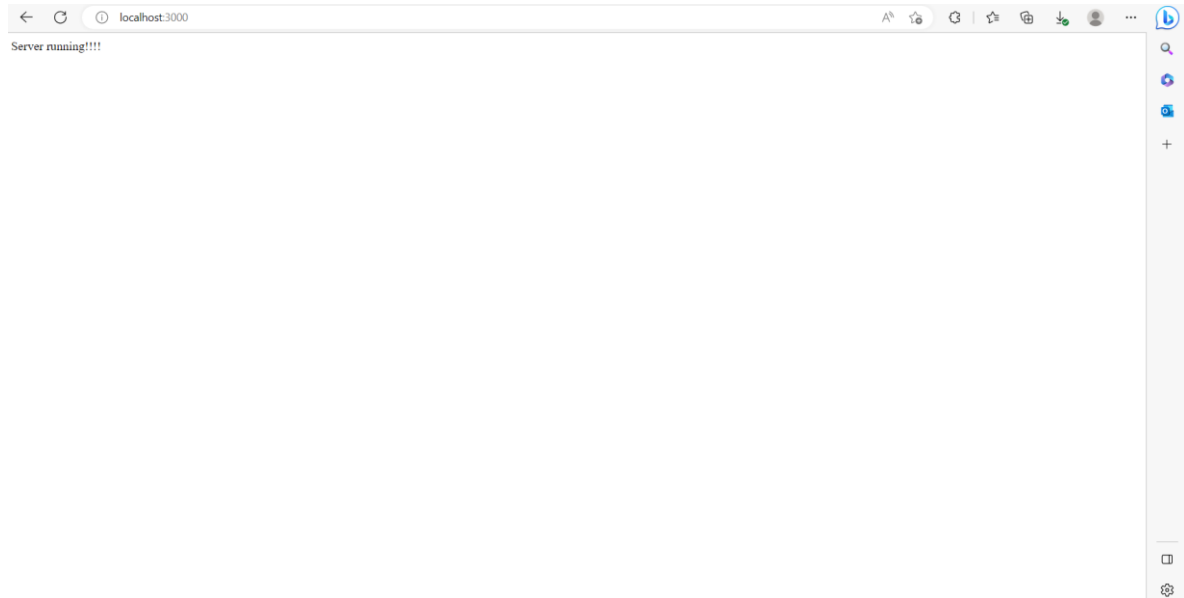

Open a route for client server.

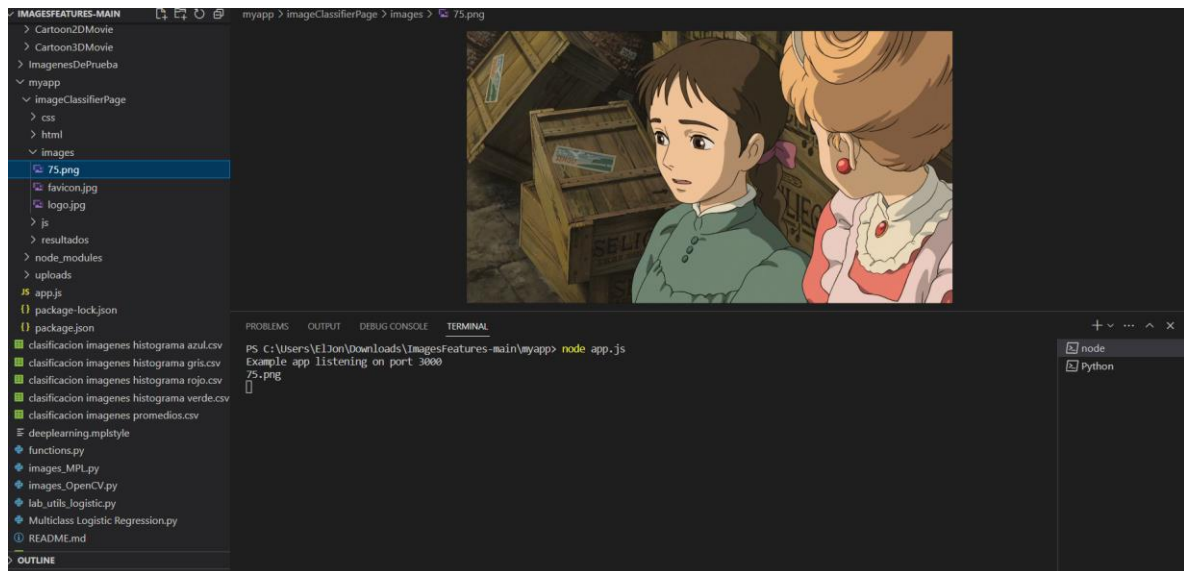

SERVER:

In terminal, cd myapp

Command in the terminal: node app.js

Receives the image from the client and saves it.

SERVER PYTHON

New terminal, and open Multiclass Logistic Regression.py Python file.

Run this file.

```
PS C:\Users\ElJon\Downloads\ImagesFeatures-main> & C:/Users/ElJon/AppData/Local/Programs/Python/Python39/python.exe "c:/Users/ElJon/Dow
ads/ImagesFeatures-main/Multiclass Logistic Regression.py"
Cartoon3DMovie
PS C:\Users\ElJon\Downloads\ImagesFeatures-main> & C:/Users/ElJon/AppData/Local/Programs/Python/Python39/python.exe "c:/Users/ElJon/Dow
ads/ImagesFeatures-main/Multiclass Logistic Regression.py"
Cartoon3DMovie & C:/Users/ElJon/AppData/Local/Programs/Python/Python39/python.exe "c:/Users/ElJon/Dow
```

The output is the classification of the image selected in the file.
